Year: 2023\2024 Course: Chemistry 1 Level: First year

TD N3: Radioactivity

Exercise 1: Complete the following nuclear reactions. For each equation, indicate the type of

reaction in question:

1-	$^{131}_{53}I \longrightarrow ^{131}_{52}Te+,$	5-	$^{215}_{84}Po \longrightarrow ^{211}_{82}Pb +$
2-	$^{124}_{53}I \rightarrow + \beta^{-}$	6-	${}^{1}_{0}n + {}^{235}_{92}U \rightarrow \dots + {}^{139}_{53}I + {}^{1}_{0}n,$
3-	${}^3_1H+{}^2_1H\longrightarrow {}^1_0n+\ldots,$	7-	$^{9}_{4}\text{Be}\left(\beta^{+},\alpha\right)^{5}_{3}\text{Li}$

4- ${}^{14}_{7}N + {}^{4}_{2}He \rightarrow {}^{16}_{8}O + ...$

Exercise 2:

1) A radioactive nucleus has a half-life of 1 s.

a. Calculate its radioactive decay constant λ .

b. At a given time, a sample of this radioactive substance has an activity of

 $11.1.10^7$ disintegrations per second. Calculate the average number of radioactive nuclei present in the sample at that time.

2) During the Chernobyl disaster, cesium 134 and cesium 137 were released into the atmosphere.

a. Cesium 137 is β - radioactive. Write the disintegration balance equation, specifying the products formed.

b. The half-life of cesium 134 is T= 2 years. Deduce the radioactive constant λ . How long will it take for 99% of the released cesium 134 to have disappeared?

Exercise 3:

By natural radioactivity, radium is transformed into inert gas and radon. A

desintegration of 35.38% of radium occurs every 1000 years.

a) Determine the radioactive constant of this transformation and the period T.

b) What is the mass of radium whose activity is 1Ci?

2. What is the activity, expressed in curies, of a radioactive source consisting of 500 mg of Strontium (90 Sc) if its period is 28 years.

a) What happens to this activity one year later.
